

Tower Heaters Upgrade

SAWO Tower heaters are upgraded to serve all sauna enthusiasts better. All our Tower heaters (Round, Corner and Wall) are now with stone spacer.

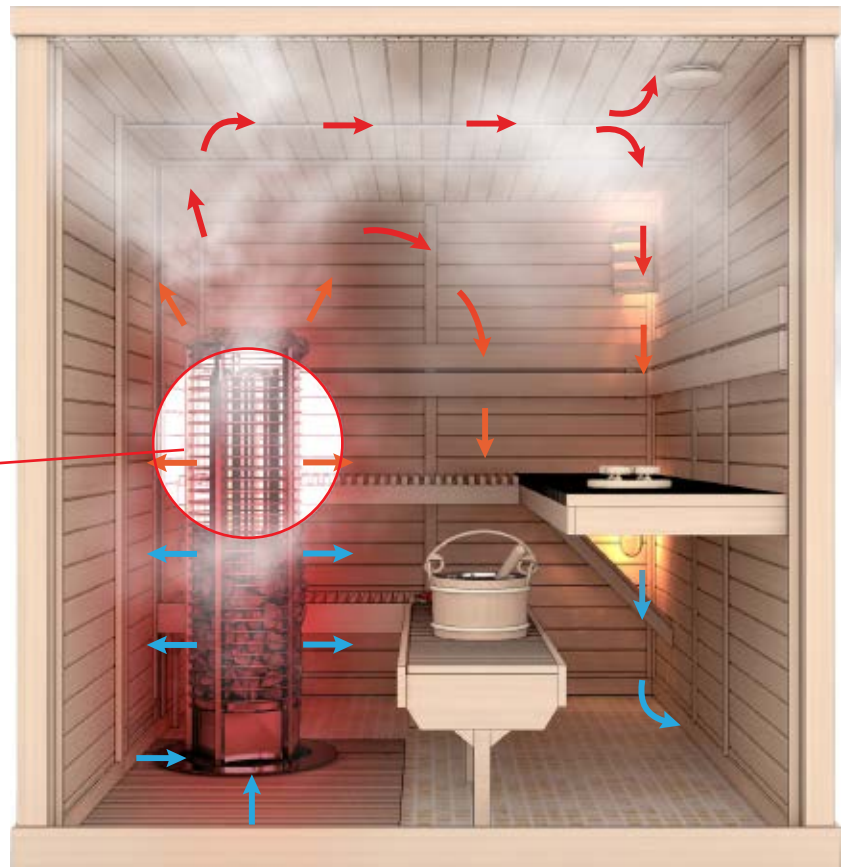

SAWO Tower heaters have different characteristics using with or without the stone spacer, and the end customer can decide whether to use it or not based on their own preferences.

No Stone Spacer

Without the tower stone spacer you will be able to have more stones into the heater. The stones will store most of the heat instead of spreading it around the room. When water is being thrown on the heater, it will release the stored energy and spread it around the sauna room. Without tower stone spacer, your heater gives you softer and more moist steam.

- More stones means more steam
- Softer steam
- Milder room temperature
- Massive amount of stones keep heat for a longer time

With Stone Spacer

The stone spacer acts like a chimney by creating a clear pathway for the hot air to travel through the heater easily. This pathway for the hot air, enables the Tower heater to breathe better which leads to reduced heating time of the sauna.

The stone spacer helps to move thermal energy efficiently from the heating elements to air, which extends the life span of the heating elements.

- Heater is now twice faster to heat up thus reduces power consumption
- Extend life span of heating element
- Improves air circulation
- Hotter room temperature
- 15-40% less stones
