## НАНО-ГЕЛЕВЫЕ АККУМУЛЯТОРЫ DYNAVOLT

**DYNAVOLT Power Technology Co.**, представляет собой концерн, специализирующийся в первую очередь на производстве мотоциклетных, скутерных, а также ATV и UTV батарей.

Компания имеет собственный научно-исследовательский институт и самостоятельно осуществляет полный технологический цикл производства аккумуляторных батарей. Результаты исследований позволили создать новое поколение НАНО-ГЕЛЕВЫХ аккумуляторов, где на молекулярном уровне улучшены свойства АКБ, и, в первую очередь, характеристики гелевого электролита.

В 2004 году **DYNAVOLT** разработал первый в мире НАНО-ГЕЛЕВЫЙ МОТОЦИКЛЕТНЫЙ аккумулятор. Фактически речь идет о новой генерации мотоциклетных гелевых батарей.

Будучи изначально наполненными специальным гелевым электролитом, нано-гелевые аккумуляторы герметично запечатаны и поставляются в готовом к эксплуатации активированном состоянии. Это делает батареи легкими и безопасными в использовании. Они не требуют пополнения раствора. При этом отсутствует опасность возникновения разлива или утечки, даже в случае повреждения наружной оболочки.

Помимо сертификации по стандартам **ISO 9001** и **ISO 14001**, компания **DYNAVOLT** является одним из немногих производителей аккумуляторных батарей, чья продукция сертифицирована на предмет величины пускового тока по стандартам **SAE** (*Сообщество Автомобильных Инженеров*), **JIS** (*Японский промышленный стандарт*), **DIN** (*Германский институт национальных стандартов*), **EN** (*Европейский комитет по стандартизации*) и **IEC** (*Международная электротехническая комиссия*).

## РАЗНИЦА МЕЖДУ ОБЫЧНЫМИ, ГЕЛЕВЫМИ И AGM-АККУМУЛЯТОРАМИ

В классическом свинцово-кислотном аккумуляторе между электродами ток протекает в электролите — водном растворе серной кислоты.

В гелевом аккумуляторе электролит представляет собой структуру, придающей ему механические свойства твердых тел, и представляет собой двуокись кремния ( $\text{SiO}_2$ ) – желеобразную массу белого цвета.

Гель позволяет добиться полной герметичности батареи, так как весь газообмен происходит внутри всего объема аккумулятора. Образованные в процессе окислительно-восстановительной реакции, свободные радикалы кислорода и водорода, удерживаются в расплаве электролита и затем превращаются в воду, которая вновь впитывается раствором. Гелевые аккумуляторные батареи, таким образом, практически не имеют вредных выделений.

В разговорах часто можно услышать “пастовый” или “гелевый” аккумуляторы. На деле существуют две технологии GEL и AGM отличающиеся между собой. Аккумуляторы, изготовленные по технологии AGM (Absorptive Glass Mat), используют электролит, которым пропитан наполнитель из стекловолокна, служащий сепаратором и предотвращающий его проливание. Данные технологии имеют схожие преимущества над традиционными АКБ.

## ПРЕИМУЩЕСТВА ГЕЛЕВЫХ АККУМУЛЯТОРОВ

- 1 Гелевый электролит гарантирует отсутствие вытекания. Батареи становятся более безопасными и устойчивыми к сильной вибрации. При этом возможна установка аккумулятора на боковую поверхность.
- 2 Нано-гелевый электролит лишен недостатков кислотных. У него не происходит разложения кислоты, поэтому можно избежать сульфации (кристаллизации солями серной кислоты) катодных пластин и коррозии анодных пластин (в нижней части пластины из-за высокого удельного веса кислоты).
- 3 Аккумулятор максимально эффективен даже не в штатных режимах работы, что позволяет эксплуатировать его в жарких погодных условиях, при температуре до  $+50^\circ\text{C}$ , или в низкотемпературных режимах, например при  $-35^\circ\text{C}$  и ниже.
- 4 Не боится глубокого разряда. Гелевый электролит находится в «связанном» состоянии, поэтому разряд аккумулятора не сопровождается его выпариванием, коррозией решетки и оползанием активной массы положительного электрода.
- 5 В гелевом аккумуляторе используется активный материал, увеличивающий емкость аккумулятора. Во время как потенциал обычных батарей значительно снижается в процессе эксплуатации, емкость гелевого аккумулятора сохраняется на более стабильном уровне, обеспечивая при этом более длительный срок службы. Этот эффект появляется после длительной эксплуатации. В сравнении с обычными аккумуляторами, срок службы гелевых аккумуляторов в два раза длиннее.
- 6 Возможность использования рядом с чувствительным электронным оборудованием.
- 7 Отсутствует газовыделение. Это уменьшает потерю массы электролита (сохраняется плотность), увеличивает производительность аккумулятора. Аккумулятор лучше переносит длительное хранение, что увеличивает срок его хранения.
- 8 Стабильно работает во влажной окружающей среде. Возможна работа даже под водой, на глубине до 10 метров.
- 9 Самая низкая удельная стоимость в соотношении «цена/количество месяцев эксплуатации», а также в соотношении «цена/ количество циклов».
- 10 Идеален как стартерная и «крутящая» батарея.

**ТРЕБОВАНИЯ** Для подзарядки батареи необходимо применять современные автоматические зарядники с регулируемым напряжением. Для увеличения срока службы не допускать перезарядки от бортовой сети (во время ТО, следует проверять реле зарядки на выдаваемый ток (13,8-14,1V).
